SME Finance Copilot: Technical Specifications & System Architecture

FinTechathon 2026 — International Track: Topic E (AI as a Financial Participant)

1. Executive Summary & Problem Context

Across emerging economies, micro and small enterprises (SMEs) face systemic financial friction. Over 80% struggle with cash flow visibility and credit access, operating without professional accounting staff. Traditional accounting platforms function purely as passive recording systems. SME Finance Copilot fundamentally reimagines financial software as an **Autonomous Financial Participant**—combining deterministic zero-float accounting, institutional credit underwriting (DSCR modeling), grounded conversational intelligence, and an autonomous voice HUD equipped with strict consequential action confirmation barriers.

2. System Architecture & High-Performance Core

The application is engineered on a **local-first paradigm**, ensuring 100% operational availability on edge hardware without mandatory third-party cloud infrastructure or SaaS dependencies:

- **FastAPI ASGI Gateway:** Asynchronous REST and WebSocket interface delivering sub-15ms response latencies.
- **Zero-Float Relational Engine:** 50 normalized relational entities in SQLite 3 with Write-Ahead Logging (WAL mode). All currency is strictly tracked in 64-bit integer minor units (cents, poisha, fen) to eliminate floating-point drift.
- **Hybrid AI & RAG Subsystem:** 11-category financial intent classifier, vector retrieval, and deterministic turnaround synthesis running locally.
- **Multi-Jurisdictional Profile Engine:** Built-in regulatory and tax models for Bangladesh (NBR Mushak 6.3), China (Fapiao 13%), Kuwait (3-decimal KWD), and regional economies.

3. Autonomous AI Copilot: The Loss Recovery Workflow

When an SME merchant faces operational deficits and asks *"I am in loss how can I recover?"*, generic LLMs fail by hallucinating generic advice or citing irrelevant legal documents. SME Finance Copilot executes an evidence-backed, deterministic 5-stage turnaround protocol grounded directly in the authenticated business ledger:

1. **Current Financial Position:** Reconciles exact operating revenue ($1,525,400.00 across 816 sales), operating expenses ($4,868,176.68 across 354 expenses), and net operating loss (-$3,342,776.68) for the 182-day period in the configured enterprise currency (USD).
2. **Root Cause Analysis:** Audits expense categories on a 100% denominator basis, detects $2,947,404.49 (60.5%) in facility and utility costs, identifies 82 duplicate entries totaling $603,000.00, and distinguishes working capital ($89,382.50 in uncollected receivables, $2,448,570.00 in inventory at cost) from immediately available cash.
3. **Prioritized 3-Phase Action Plan:** Days 1–15 immediate liquidity defense and duplicate ledger reconciliation; Days 16–45 overhead restructuring; Days 46–90 margin acceleration.
4. **Quantified Turnaround Scenarios:** Grounded mathematical models: 5% expense reduction yields **$243,408.83** in reduced cash outflow; 10% sales volume growth adds **$152,540.00** in top-line revenue (~$22,651.78 margin contribution); combined gross turnaround yields **$395,948.83** (estimated net deficit reduction of **$266,060.61**).
5. **Intent-Gated Document Citations:** Vector retrieval enforces domain boundaries; bank loan sanction letters are strictly suppressed for operational questions, ensuring zero false-positive citations.

4. Credit Underwriting & Institutional DSCR Engine

To bridge the SME credit gap, the platform features an institutional loan underwriting engine. It computes real-time amortization schedules, total interest, and Debt Service Coverage Ratios (DSCR) against commercial bank underwriting standards (1.25x minimum benchmark). Merchants can match products across 5 commercial banks and instantly generate official Credit Underwriting Packet PDFs with watermarked cryptographic verification hashes.

5. Quality Assurance & Test Verification Summary

The system has been verified through a formal catalogue of **50 Numbered Test Cases (TC-01 through TC-50)** with **224 out of 224 automated unit, integration, and security tests passing (100% pass rate)**:

Test Suite Focus Area	Files	Tests	Pass Rate	Verdict
AI Intent Routing & Turnaround Scenarios	test_ai_copilot_intelligence.py	13	100%	PASS
RAG Embeddings & Tenant Isolation	test_rag_pipeline.py	14	100%	PASS
API Routes, Cash Forecasting, OCR	test_api_integration.py	10	100%	PASS
API Security, Path Traversal, Division Guards	test_api_security_verification.py	19	100%	PASS
RBAC & 7 Selectable Demo Personas	test_auth_and_rbac.py	8	100%	PASS
Loan EMI, DSCR & Underwriting Packet	test_loan_and_dscr_module.py	8	100%	PASS
CRM RFM Segmentation & Inventory Valuation	test_crm_and_inventory.py	9	100%	PASS
Persistence, CSV Injection & WAL Backups	test_report_generation_and_storage.py	8	100%	PASS
Multilingual Voice AI & Action Barriers	test_voice_ai.py	10	100%	PASS
Web UI, Dashboard KPIs & Portals	test_web_ui.py / test_dashboard.py	18	100%	PASS
TOTAL REGRESSION SUITE	**21 Test Suites**	**224**	**100%**	**100% PASS**

6. Security Safeguards & Disaster Recovery

• **Client Header Forgery Defense:** Client headers (X-User-ID) are strictly discarded; identity is derived solely from signed HMAC SHA-256 tokens.
• **Adversarial Prompt-Injection Defense:** Jailbreak patterns (DAN, system overrides) trigger immediate security refusal.
• **Consequential Action Authorization Barrier:** Autonomous state-changing operations require explicit cryptographic two-step user confirmation.
• **CSV DDE Sanitization:** Formulas starting with =, +, -, @ are escaped with leading quotes to prevent spreadsheet macro execution.
• **Disaster Recovery:** Verified SQLite WAL-safe backups (23.46 MB, 163,054 records) with SHA-256 integrity manifests.
